

## How to install Both VPN clients and use Netgear PROSafe VPN Client & Cisco VPN Client?

It is common that installing multiple VPN client may not work correctly

With simple batch file it is possible to use multiple clients at one windows based machine. The trick is to start the required services only when needed. The start of a windows service can be accomplished by means of a bat-file.

For every client you will have to create a batch file which will call a general batch file stopping all available clients, after that the services for for instance Cisco needs to be started. For example to stop all clients use:

Stop-all.bat

```
-----  
rem Stop the services for the Nortel VPN Client  
  
net stop ExtranetAccess  
sc config "ExtranetAccess" start= demand  
  
rem *****  
rem Stop the services for the Cisco client  
  
net stop cvpnd  
sc config "CVPND" start= demand  
  
rem *****  
rem Stop the services for the Checkpoint client  
  
net stop SR_Service  
net stop SR_Watchdog  
sc config "SR_Service" start= demand  
sc config "SR_Watchdog" start= demand  
  
rem *****  
rem Stop the services for the windows IPSec client  
  
net stop policyagent  
sc config "policyagent" start= disabled
```

To start the cisco client use:

Dial Cisco.bat

```
rem *****  
rem Stop all services for all clients if required  
  
sc query CVPND | grep RUNNING  
if errorlevel 1 Call "c:\Program Files\vpn\stop-all.bat"  
  
rem *****  
rem start the services for the Cisco Client  
  
net start cvpnd  
  
rem start the appropriate client  
  
"c:\Program Files\vpn\VPN xxxx.lnk"
```
